How to Become Ansem —
The Black Bull Blueprint

From the Trenches — An Independent Field Manual

THE BLACK BULL BLUEPRINT

\$ANSEMnomics

*How to Become Ansem —
Discipline, Influence, Community & Crypto Culture*

An independent, unofficial field manual on the journey of Zion
Thomas (@blknoiz06)

Written & compiled by Isaac Forson
@isaacforson · Ghana AI Report

An Honest Note Before You Begin

This is an **independent, unofficial work**. It is not written, authorized, endorsed by, or affiliated with Ansem / Zion Thomas, @blknoiz06, BullpenFi, the \$ANSEM token, or any related project. It is a commentary-and-lessons portrait assembled from publicly available information and news reporting as of July 2026. Where a detail could not be independently verified, it is described in general terms.

Nothing in this book is financial, investment, legal, or tax advice. Cryptocurrencies — and memecoins in particular — are **extremely high risk**. Most go to zero. A token bearing someone's name is not created or controlled by that person; always verify a token's contract address yourself. Never risk money you cannot afford to lose.

The purpose of this book is not to promote any coin. It is to study the **habits, discipline, and character** behind one of crypto's most-followed voices — the parts genuinely worth learning — while being honest about the risks that surround them. Read Chapter 13, "The Other Side of the Bull," as carefully as you read the rest.

All illustrations in this book are original artwork created for this edition.

How to Use This Book

This is a **field manual** — not a biography, and not investment research. It studies the habits behind a public career and turns them into practice you can run in your own arena, whatever that arena is.

Read it in order, or jump to the trait you need. Every chapter ends with a **Charge Forward** box: one specific action. Do them — that is where the value lives. The lessons are built to outlast any single coin or cycle; if Solana vanished tomorrow, most of them would still hold.

Hold two ideas at once: admiration for the discipline, and clear eyes about the risk. Chapter 13 exists for the second one. Read it as carefully as the rest.

Where a detail comes from Ansem's own statements or public profiles rather than a primary record, the text says so ("reported," "by his own account"), and the **Appendix** lists the sources. Verify anything that matters to you — including, always, a token's contract address. Nothing here is financial advice.

PROLOGUE

The Charge of the Black Bull

Where the story begins — and why it matters far beyond one coin.

In mid-June 2026, a token nobody had heard of appeared on Pump.fun. Within weeks it was one of the loudest trades on Solana.

The token is called \$ANSEM — “The Black Bull.” By early July 2026 it was moving fast: depending on how you count the supply, its valuation sat somewhere between roughly \$70 million (circulating basis) and over \$275 million (fully diluted), with the holder count climbing toward 100,000 and a stated ambition of reaching one million. Those are not small numbers for a coin that, weeks earlier, did not exist.

Here is the twist most people miss, and the first lesson of this book: Ansem did not create it. An anonymous developer launched the token and sent a large share of the supply to Ansem’s public wallet, betting that a famous name attached to an unknown ticker would manufacture attention. It worked. But rather than dump the windfall, Ansem leaned in and did something unusual — he airdropped roughly \$7 million worth of tokens back to Solana users, framing it as a “stimmy for the

trenches” and a way to onboard a million new people into crypto.

This is not a book about a coin. It is a book about the man the coin is named after — and the habits that made his name worth naming.

Zion Thomas — known online as Ansem, @blknoiz06 — is a Georgia Tech computer-science graduate, a former software engineer, an amateur boxer, an early Solana believer, a newsletter writer, and a builder of tools for ordinary traders. The coin is a symptom. The person is the study. What follows is a field manual drawn from his public journey: the discipline, the transparency, the conviction, and the generosity that turned a trader posting his calls for a small following into one of the most-followed and most-referenced voices in the space.

Read it from anywhere — Accra or Brooklyn, a bedroom or a trading desk. The arena changes. The traits don’t. Charge forward.

The Awakening

From Georgia Tech engineer to crypto visionary.

Every conviction trader starts as a frustrated one.

Zion Thomas was strong in math and science early. According to his public profiles and interviews, he earned a BS in Computer Science at Georgia Tech, and after graduating around 2017 he worked as a software engineer at Capital One. Crypto entered the picture the way it does for a lot of engineers — through curiosity about Bitcoin as a system, not just a price.

The turning point was ordinary. In early 2020, juggling real life and responsibilities, he watched DeFi Summer unfold on Ethereum and found himself priced out by punishing gas fees. That frustration is where the thesis was born. Instead of complaining, he researched: if a faster, cheaper alternative chain could actually deliver, it would matter enormously. He was drawn to Solana — partly by the engineering pedigree behind it — and, by his own account, bought in when SOL was around \$1.50.

He had already lived through the brutal 2017-2018 bear market, so he understood cycles in his bones. And in 2020, with

a tiny audience, he began doing the thing that would quietly change everything: journaling his trades in public, for accountability, not applause.

The engineer's edge wasn't a secret indicator. It was patience plus research plus skin in the game.

CHARGE FORWARD — DO THIS

Find the one frustration in your own field that keeps recurring. Spend 30 days researching the alternative nobody's taking seriously yet. Write down what you learn — publicly if you can. That document is your first asset.

The Fighter's Mindset

Boxing discipline as a metaphor for the market.

Before the charts, there was the ring.

Ansem has spoken about training as an amateur boxer and stepping into the ring for crypto “fight night” events — the kind of public bouts that demand real preparation rather than bravado. Whatever the scorecards said on any given night, the point was never the knockout. The point was the training: the unglamorous, repeated, watched-by-nobody work that separates people who perform under pressure from people who fold.

Boxing is an almost perfect metaphor for trading and for building an audience. You wait for the opening instead of swinging wildly. You read your opponent — in markets, that’s sentiment, order flow, and narrative. You size your commitment to the risk in front of you. You absorb hits without quitting mid-round. And when you lose, you recover, review the tape, and come back sharper.

This is the same temperament that let him hold conviction through Solana’s worst stretch, when quitting would have been

the comfortable choice. Discipline built in one arena transfers to every other one.

Talent without discipline loses. Discipline shows up when no one is watching — and the market always finds out.

CHARGE FORWARD — DO THIS

Keep a “fight journal” for every serious position or decision: What’s the setup? What’s my risk? What will I do when it turns against me? Review it weekly the way a fighter reviews tape. Pair it with real physical discipline — the body trains the mind.

The Journal Revolution

Turning private trades into public power.

Early on, with a small following, he began posting his trades in public.

It began as pure accountability — a way to keep himself honest. But something compounds when you publish your process in a space full of anonymous promises: people can check your work. As his calls on Solana and early memecoins played out, followers could verify the timing themselves. Credibility didn't come from a marketing budget. It came from a public record.

The most counter-intuitive part is that he posted the losses too. In a corner of the internet built on selective screenshots of wins, openly admitting a bad trade and emphasizing disciplined exits was radical. It was also the entire moat. Anyone can fake a win. Almost nobody volunteers their losses. Doing so made the wins believable.

Transparency is the one advantage that competitors can't copy without becoming honest themselves.

CHARGE FORWARD — DO THIS

Start posting one thesis or decision publicly each week — with your reasoning and your risk. Include the misses. In a month, re-read your own posts. Verification is the fastest compounding asset you have.

Deeper Waters

Substack as thought leadership and educational legacy.

Tweets built the audience. Long-form built the respect.

In late 2021, after someone suggested he turn his trade journal into a blog, Ansem launched a newsletter. What started as extended versions of his posts grew into quarterly market outlooks, macro syntheses, and deeper analyses, and it built a substantial subscriber base. By his own account, professional investors — including people at venture funds — told him they were following what he wrote about the market.

That shift matters. Short posts win attention; long-form earns authority. Writing at length forces you to actually think — to defend a thesis, name the risks, and connect the dots between macro, on-chain data, and narrative. It's the difference between a fleeting influencer and a voice that lasts.

It also revealed something about his motive. He has repeatedly framed his presence online around helping people learn what he's already learned. The newsletter was education, not just broadcast.

If you can't write a thousand honest words defending your idea, you don't yet understand your idea.

CHARGE FORWARD — DO THIS

Once a month, write a 1,000+ word deep dive on a thesis you hold. Explain why it works, and — just as important — what would prove you wrong. Publish it. This is how a caller becomes a thinker.

Solana Odyssey

Conviction through the darkest hours.

In 2022 and early 2023, most of crypto had written Solana off entirely.

Volumes had collapsed, the FTX implosion had hit the ecosystem hard, and “dead chain” was the consensus. Consensus is comfortable. It is also frequently wrong at extremes. Ansem stayed publicly bullish, tracked what was actually being built, and even leaned into the mockery — rallying believers and turning insults into an in-group identity rather than a wound.

Crucially, his conviction wasn’t blind faith. It was research-backed: real development continuing beneath dead-cat price action, teams still shipping, and a thesis about performance that hadn’t broken. When the next cycle arrived, the chain delivered, and the people who’d held through the worst were rewarded.

Conviction without research is gambling. Research without conviction is noise. You need both, and you need them most when it's lonely.

CHARGE FORWARD — DO THIS

Pick one asset or idea you believe in while the crowd is bearish. Write down your thesis and the specific data points supporting it. Set a reminder to revisit it in 6-12 months. Let reality grade your conviction.

Memecoin Genesis

Igniting a cult and activating community power.

*The most important word in “memecoin” is not “coin.”
It’s “meme” — and memes are made by crowds.*

Ansem’s most famous early call came from spotting a small, funny token in a microcap channel and recognizing the cultural spark in it. But he is the first to say the explosion wasn’t his doing alone. What turned a joke into a phenomenon was community activation: profile-picture edits, chaotic live streams, and an army of people posting relentlessly, every single day, until the meme became a shared identity.

That’s the real lesson, and it’s widely misunderstood. He didn’t manufacture a movement by shouting louder. He recognized authentic culture and then empowered other people to build it with him. Movements that last are co-created; a crowd defends what it helped make.

You don’t command a culture into existence. You spot it, feed it, and get out of the way of the people carrying it.

CHARGE FORWARD — DO THIS

Find one genuine cultural moment forming in your space — not one you invented, one that's already alive. Support the creators driving it and amplify authentically. Ask “how do I help this grow?” not “how do I own this?”

The Institutional Bridge

Credibility without losing the voice.

The rarest move in crypto: operate at the top without abandoning the trenches.

In 2022, Ansem took on a research role at an investment firm's crypto arm, focused on early-stage Web3 investments. This is where a lot of influencers either sell out or get captured — they gain a title and lose the authentic voice that made them worth listening to. He managed to hold both: institutional-grade analysis and rigor on one side, an unfiltered retail voice on the other.

The value of that bridge runs in both directions. Institutions got access to a genuine read on retail culture and on-chain reality; retail got someone in the room where allocation decisions get made who still spoke their language. Credentials opened higher doors, but he walked through them without changing who he was.

Build credentials that open doors. Keep the voice that made you worth opening the door for.

CHARGE FORWARD — DO THIS

Identify one credential — a role, a body of research, a portfolio of public writing — that would let serious people take you seriously. Pursue it deliberately, and decide in advance which parts of your authentic voice you refuse to trade away.

Builder's Legacy

From calling plays to building the arena.

Talk is cheap. Tools are permanent.

Ansem didn't stop at commentary — he got involved in building. The project most associated with this is BullpenFi, a non-custodial on-chain trading terminal designed to bring professional-grade capabilities to ordinary traders: things like social leaderboards, smart-money tracking, automated orders, fast execution, and a mobile-first experience. The stated intent is retail empowerment — giving regular people the kind of tools that were once reserved for insiders.

This is the graduation move. Callers rise and fall with the cycle. Builders create infrastructure that keeps working — and keeps a community together — long after any single trade is forgotten. Building is also the ultimate expression of “I’m here to help,” because a good tool helps at scale, silently, every day, without you in the room.

The influencer sells the play. The builder builds the stadium the players win in.

CHARGE FORWARD — DO THIS

Look at your field and find the gap — the thing that's harder, more expensive, or more gate-kept than it should be for ordinary people. Support or build the thing that closes it. Move one step from commentary toward creation.

Modus Operandi

Analysis, posting, and ethical influence.

How he actually operates, distilled.

Strip away the mythology and a repeatable method remains. He spends real time on the unglamorous inputs — charts, narratives, on-chain data — before forming a view. He waits for organic strength rather than trying to will something into existence; with \$ANSEM itself, he reportedly watched real volume develop before engaging. He posts transparently, admits when he's wrong, and treats his influence as a responsibility rather than a slot machine.

The ethical filter is the part worth internalizing, because influence without it curdles into extraction. The simplest version of the test: before amplifying anything, ask whether it genuinely helps the people who trust you — or whether it only moves a price in your favor.

*Analyze deeply. Post honestly. Amplify responsibly.
Help first — and let that constrain what you're
willing to say.*

CHARGE FORWARD — DO THIS

Before your next big post or recommendation, run the one-line test: “Does this help the people who trust me, or does it just move price?” If you can’t answer cleanly, don’t post it.

The \$ANSEM Vanguard

Decentralized brand influence — and its double edge.

The most instructive thing about \$ANSEM is how it was handled, not how high it went.

The token launched anonymously and was airdropped into Ansem's wallet without his involvement. He had a choice most people never face: dump a windfall quietly, ignore it, or do something else. He chose to wait for genuine volume, then redistribute value — airdropping roughly \$7 million back to Solana users, weighting toward smaller holders, and framing the whole thing as onboarding rather than extraction. His stated goal was to grow the base from tens of thousands of holders toward a million and pull new people into crypto.

That inverts the usual script, where creators harvest a crowd. By routing value back to holders, he converted an adversarial game into something that at least felt positive-sum — and activated two powerful forces: reciprocity (people who receive want to give back) and identity (holding became a way to belong).

But honesty requires naming the other edge of this sword, and it's the real lesson of the chapter. The entire structure depends on one person. His wallet still holds a dominant share of supply, which means the same generosity that lifted the token is also its central risk. That is not a knock on him; it's the physics of a brand-tethered coin. Which leads directly to the most important chapter in this book — the one most “blueprints” leave out.

When influence lands in your lap, the choice between extracting and redistributing is the whole story of your reputation.

CHARGE FORWARD — DO THIS

When you gain influence or a windfall, design the giveback before you design the take. Decide, in advance, how you'll route value to the people who made it possible.

The Heart of the Bull

Helping the trenches, transparency, and staying grounded.

Fame is a solvent. It dissolves the people who don't have something solid underneath.

For all the noise, the throughline in how Ansem describes himself is simple: he likes helping people, and he feels he's in a position to share what he's already learned. That's the engine under the newsletters, the public journaling, the tools, and the airdrops. Whether or not any single trade works out, the stated why is consistent — pass down the knowledge, the way the people who taught him once did.

He also guards the things that keep a person whole. He keeps his family life private amid enormous public attention. He treats grand titles — “Memecoin King,” “Solana Guy” — with a shrug rather than a crown. He handles a constant flood of tokens sent to his wallet without turning every one into a paid endorsement. Groundedness, it turns out, is not the opposite of ambition. It's what makes ambition survivable.

Success without losing your humanity — and your desire to help — is the real flex.

CHARGE FORWARD — DO THIS

Write down your actual “why” for wanting success, and name the things you will protect no matter how big you get: family, health, privacy, integrity. Guard them on purpose, before the pressure arrives.

The Ultimate Blueprint

Twelve traits, and how to make them yours.

You don't need to be Ansem. You need his operating system.

Here is the whole book compressed into a checklist you can actually run. Master the fundamentals of your craft. Build fighter discipline in body and mind. Journal in public for accountability. Write long-form to sharpen your thinking. Hold researched conviction through the dark. Activate communities instead of shilling at them. Bridge the retail and institutional worlds without losing your voice. Build real tools that empower other people. Analyze deeply and post ethically. Redistribute value the moment you have influence to spare. Stay transparent and stay grounded. And charge forward relentlessly, no matter the odds.

None of these is exotic. That's the point. The edge isn't a secret — it's the willingness to do ordinary disciplined things, in public, for years, while helping the people around you. Most won't. The ones who do become the name others build coins around.

Review these twelve every week. Pick one to sharpen. Repeat until they're who you are.

CHARGE FORWARD — DO THIS

Copy the twelve traits somewhere you'll see them every Sunday. Each week, grade yourself on one and improve it. In a year you won't be imitating anyone — you'll be the standard in your own arena.

The Other Side of the Bull

A clear-eyed look at the risk.

A book that only shows you the winners is not a blueprint. It's a highlight reel. Here's the honest ledger.

Everything admirable in Ansem's story — the discipline, the transparency, the community-building — is real and worth emulating. But the \$ANSEM token that inspired this book is a memecoin, and memecoins are among the riskiest assets that exist. Being clear-eyed about this is not cynicism; it's the same research-first discipline the whole book preaches.

He didn't create it. \$ANSEM was launched by an anonymous developer who airdropped supply to Ansem's wallet. Several rival "\$ANSEM" tokens appeared at the same time. The blunt lesson: a name on a token tells you nothing about who made it. Always verify the contract address yourself before touching anything.

The concentration is extreme. Reporting and on-chain screeners indicate one wallet controls roughly 60%+ of supply, and tools like RugCheck have flagged manipulation risk from that concentration. When one holder owns most of a token, that

holder can move the price violently — and retail provides the liquidity they'd sell into. It doesn't require bad intent for this to end badly; a single large exit is enough.

There are no fundamentals. No revenue, no roadmap, no cash flow — the value rests almost entirely on one person's reputation and continued involvement. That's the bull case and the bear case in the same sentence.

The controversy is real too. On-chain investigator ZachXBT has publicly accused Ansem of using his following as exit liquidity for low-cap tokens; Ansem disputes this. A serious reader holds both the admiration and the criticism at once, rather than picking the flattering half.

The base rate is brutal. By credible estimates, the overwhelming majority of Pump.fun traders never clear even modest profits, and most memecoins ultimately go to zero. For every life-changing screenshot, there are many quiet losers holding the top.

Emulate the man's habits. Do not confuse admiration for a person with a thesis for a trade.

CHARGE FORWARD — DO THIS

If you ever participate in an asset like this, treat it as a tiny, losable speculation — never a core holding. Decide your exit before you enter, size it small, verify the contract, and never risk money you can't afford to lose. None of this is financial advice.

Charge Forward — Your Turn

Ansem didn't become Ansem overnight, and he didn't become Ansem by accident.

He combined a technical foundation, physical and mental discipline, radical transparency, researched conviction, real community-building, actual building, and a genuine desire to help — and he did it consistently, in public, through cycles that broke other people's resolve. The coin is a moment. The method is the thing worth keeping.

You don't need to copy him. You need to run his operating system in your own arena — trading, building, writing, business, or a media platform read from Accra to the rest of the world. Discipline transfers. Transparency transfers. Generosity transfers. The trenches are wherever you're fighting to build something real.

*The charts are open. The culture is yours to build.
Now go charge.*

Evidence, Sources & Methodology

The homework behind the habits.

Methodology

This book is an independent, unofficial work, assembled from public reporting, published profiles, interviews, and on-chain data available as of July 2026. It is a lessons-and-habits portrait, not a primary-source biography. Several biographical details — education, employer, early trades, boxing results — come from Ansem’s own public statements or secondary profiles and have not been independently verified against primary records; where that is the case, the text uses language like “reported” or “by his own account.” No private wallet addresses are published here, out of respect for privacy. Market and token figures move constantly; every number is a snapshot. Nothing in this book is financial, investment, or legal advice.

Timeline (as reported)

Early 2000s — Born; grew up in New York, per public profiles.

~2017 — Earns a BS in Computer Science at Georgia Tech; joins Capital One as a software engineer; begins exploring crypto.

2020-2021 — Begins posting his trades publicly; reportedly goes full-time in crypto around 2021.

2022 — Named Head of Research at TCG Crypto (part of The Chernin Group).

2023 — Widely credited with calling Solana’s recovery (roughly \$8 to near \$300); early and vocal on WIF and BONK.

Apr 19, 2024 — Competes at Crypto Fight Night IV, Dubai; reported stopped by TKO, losing to Louis “Barney” Smith.

Dec 6, 2024 — Faces Ben “BitBoy” Armstrong at Crypto Fight Night V, Dubai; bout reported as a majority draw.

Late 2024 — On-chain investigator ZachXBT publicly alleges pump-and-dump-pattern promotion of low-caps; Ansem disputes it. No known regulatory action.

2024-2026 — Builds/co-founds BullpenFi (bullpen.fi), an on-chain trading terminal.

Jun 17, 2026 — An anonymous developer deploys “The Black Bull” (\$ANSEM) on Pump.fun (cost ~\$6,300) and sends ~650M tokens to Ansem’s wallet.

Jun 27-29, 2026 — Ansem airdrops ~\$7M of \$ANSEM to 700+ wallets (“a stimmy for the trenches”), targeting growth from ~25,000 to 1,000,000 holders.

Late Jun-Jul 2026 — \$ANSEM runs from tens of thousands to a nine-figure valuation; perps list on venues including MEXC and Aster.

On-chain & market notes

Ansem did not create \$ANSEM. He has publicly disavowed copycat tokens and said that linking his account to a launchpad address only proved he *could*, not that he endorsed any specific project. Multiple unrelated “\$ANSEM” tokens launched at once; none is an official canonical version.

Analytics firm Bubblemaps reported roughly 604 million tokens — about 60% of supply — in Ansem’s wallet, an extreme concentration. The original deployer reportedly netted only ~\$5,500 after fees, far below sensational headlines.

Valuations vary by method. CoinGecko showed a circulating market cap near \$73M with an all-time high of \$0.1876; fully-diluted figures (for example on DexScreener) ran materially

higher during the peak. The gap reflects how much supply sits in a single wallet — which is exactly why the metric you cite matters. Verify holder distribution with on-chain tools (e.g., GeckoTerminal, RugCheck) before trusting any headline number.

Criticism & context

The admiration in this book is not the whole picture, by design. ZachXBT's late-2024 allegation is the most cited criticism; Ansem disputes it, and as of mid-2026 no formal enforcement action against him is publicly known. DeFi researcher Ignas characterized \$ANSEM as “tokenized attention and reputation” — buyers opt in voluntarily, but most such tokens carry no revenue or product. Rare outsized wins (a reported ~\$2,300 turning into ~\$600,000) are real but extraordinarily uncommon, and they function as marketing; the base rate is that most participants lose.

About the Author

Isaac Forson is the founder of **Ghana AI Report**, a media platform covering artificial intelligence, crypto, and emerging technology through an African lens — connecting the biggest global developments to real Ghanaian and continental relevance.

Writing from Ghana, and drawing on more than a decade in the telecoms and technology industry, he covers this space for people who want signal over noise: what actually matters, why it matters here, and what to do about it. He is also a builder, with active interests in education technology and fintech for African users.

His conviction is simple: the next wave of crypto and AI adoption will be shaped as much in Accra as in New York — and the traits that win in the trenches (discipline, transparency, conviction, and genuine community) travel everywhere. This book is written in that spirit: study the best, stay honest about the risks, and charge forward in your own arena.

Follow the work and join the conversation on X: **@isaacforson** — and

\$ANSEMnomics

From a Georgia Tech engineer to an amateur boxer, from early Solana conviction to memecoin culture leader, from public trade-journaler to institutional researcher and builder — the journey of Zion Thomas (@blknoiz06) is a masterclass in how reputation is really built.

This book distills that journey into twelve teachable traits: fighter discipline, radical transparency, researched conviction, community activation over solo hype, building tools that empower others, ethical influence and value redistribution, and staying grounded while scaling impact — and, unlike the highlight reels, it looks the risk squarely in the eye.

| *“The arena changes. The traits don’t. Charge forward.”*

Whether you’re in the trenches, building a product, or growing a platform of your own, these principles will change how you approach risk, community, influence, and the long game.

\$ANSEMnomics | An independent, unofficial field manual | Not financial advice
